

**Multilayered Vesicles Formed by Polyaromatic Oligoamines**J. Jevrić<sup>1</sup>, S. M. Langenegger<sup>1</sup>, R. Häner<sup>1\*</sup><sup>1</sup>University of Bern

Supramolecular phenanthrene polymers with a negative charged phosphate backbone have been synthesized in our group.<sup>[1,2]</sup> These assembled oligomers can act as light harvesting antennas. Herein we replaced the negative charged phosphate backbone by a positive charged amine one and analyzed the aggregation behavior and light harvesting properties. The self-assembly of 1,8-disubstituted amine-linked phenanthrene trimers in aqueous solution formed mono- and even multilayered vesicles based on atomic-force microscopy. The incorporation of pyrene into the vesicles allows an investigation of light harvesting properties.
